Greater One-horned Rhinoceros by Chungba Sherpa

FOREWORD

Nepal has a strong commitment for conservation of its rich biodiversity, allocating nearly one fourth of its landmass as protected areas. Shuklaphanta National Park (ShNP) is one of the important protected areas in Nepal representing the Western part of the Terai Arc Landscape. It lies at the south-western corner of Nepal in Kanchanpur district (Far West State). The Park is comparatively small covering 305 km² within the altitude range of 175 to 1300m. The core area of the park is surrounded by buffer zone where people live in high density. However, The ShNP is the home for many rare and globally threatened species of flora and fauna. The park has transboundary importance as it is connected to the Indian protected areas through the biological corridors and frequent movement of large mammals has been well documented. Although, park is rich in biodiversity, there are only a few attempts to systematically document it.

On this background, the ShNP attempts to publish this book with photographs of the mammal species obtained during camera trapping surveys from the park. There are 37 mammalian species with photographs in the park out of 56 species recorded there so far. Among them, 12 are globally threatened and 20 are nationally threatened. This confirms ShNP as a site of international significance for the wildlife conservation. The distribution maps and the photographs of each species presented in the book will serve as an invaluable resource for the researchers interested in particular species or mammalian species of the park.

The Department of National Parks and Wildlife Conservation always encourages in updated information about the status of wildlife and their habitat in protected areas network. Such information also helps in setting conservation priorities in the respective parks. In this context, Shuklaphanta National Park has published this camera trapped photographic book with the technical support from National Trust for Nature Conservation, WWF Nepal and ZSL Nepal. I would like to congratulate Shuklaphanta National Park and all the compilers for publishing this book and thank for their efforts to reveal this valuable scientific work.

I strongly believe that this book will generate big interests in people towards conservation and supports in enhancing wildlife tourism in ShNP.

Gopal Prakash Bhattarai
Director General

ACKNOWLEDGEMENTS

Publication of this book is possible from the sincere contributions of several individuals and organizations. I would like to thank Department of National Parks and Wildlife Conservation, Department of Forests and Soil Conservation, National Trust for Nature Conservation, WWF Nepal, Panthera and ZSL Nepal for supporting camera trapping surveys in the Park.

On behalf of Shuklaphanta National Park Office, I would like to thank all staff of Shuklaphanta National Park (ShNP) including Account Officer Shankar Singh Kunwar, Section Officer Gauraj Bahadur Limbu, Assistant Conservation Officers Uttam Kumar Chaudhary and Sailendra Chaudhary; Rangers Janaki Bhandari, Prayash KC, Anil Rasaili, Yam Bahadur Rawat, Dharmajit Saud, Puran Dev Mishra and Gyanendra Bahadur Shah; Computer Operator Laxmi Bhatta; Kharidar Chanu Ram Rana, Kumari Renu Yadav and Ganesh Dutt Bhatta; Senior Gamescouts, Gamescouts, Office Assistants, Drivers, Elephant Staff and all crew members of the field survey. I would like to thank ShNP's former Chief Conservation Officer Bed Kumar Dhakal and Assistant Conservation Officer Gopal Bahadur Ghimire, and DNPWC's Assistant Ecologists Rishi Ranabhat and Bhupendra Prasad Yadav.

I would like to thank Sudarshan Neupane, Pramod Subedi, Hemanta Yadav (former Office-In-Charge) from NTNC/SCP. The camera trapping fieldwork in Shuklaphanta would not be possible without the tireless efforts of NTNC's wildlife technicians Dev Raj Joshi, Ganesh Rana, Amar Singh Thakur, Shankar Lal Tharu, Jog Raj Rana, Deep Prasad Chaudhary, Ramesh Darai, Binod Darai, Om Prakash Chaudhary, Suman Malla and Shreeram Tharu.

I would like to thank Devidal Battalion, Nepali Army for providing support during field work. Very special thanks to Battalion Commander Lieutenant Colonel Raju Basnyat and his team. I would like to thank NTNC's Dr. Ashish Gurung, WWF Nepal's Samundra Subba and ZSL Nepal's Sailendra Raj Giri for their contributions during the tiger monitoring through camera trap survey. I am very much grateful to Chungba Sherpa, Dhiraj Chaudhary, Kaviraj Bohara, Kum Karan Thakur, Vikram Tiwary and Yam Bahadur Rawat for providing photographs captured inside the park.

I would like to thank all the authors of this book for their determined work during the photo extraction and analysis, map preparation and write up the manuscript.

Laxman Prasad Poudyal
Chief Conservation Officer

Preface

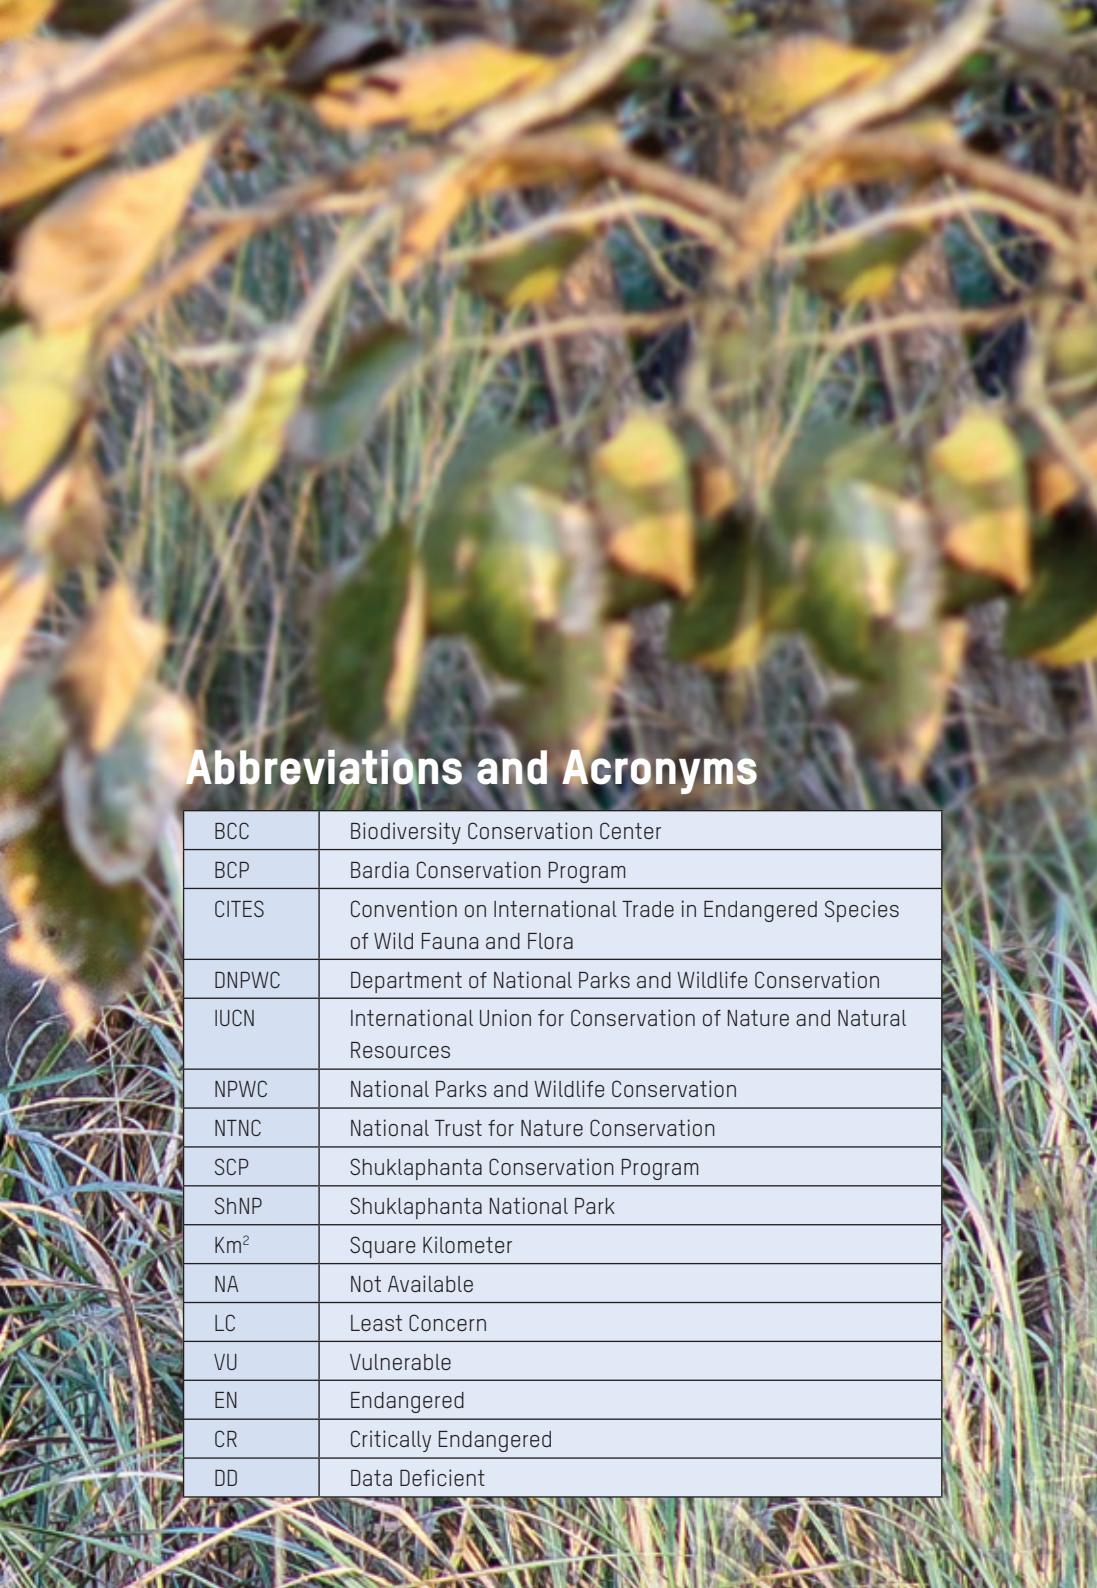

The Shuklaphanta National Park is often mirrored with the largest herd of Barhasinga (Swamp Deer) which is true but it does not end here. The Park also provides habitat for many other wildlife including Tiger, Rhino, Elephant, Sloth Bear, Leopard etc. At one point in history it was famous for its highest tiger density in the world. Not only has the big and charismatic wildlife, the park also held lesser known wildlife such as Rusty-spotted Cat, Ruddy Mongoose, Hispid Hare and Chinese Pangolin. In the past decade, regular and intensive surveys in the park using digital camera traps enabled us to detect various fascinating but cryptic wildlife which would not be seen otherwise.

Most of these camera trapping surveys were conducted targeting at Tigers. The Tiger photographs are immediately analyzed to estimate the Tiger population and rest of the photographs remain in the depository. In one hand, such data remained unused at the data depository and often high risk of data loss due to lack of institutional arrangement to store data. On the other hand, conservationists, researchers and others interested in these species cannot access such information. Only those who are directly involved in camera trapping have some information in raw form about these species. Realizing such situation, we initiated to publish this book with camera trap records of all mammal species in the Shuklaphanta National Park. We carefully looked at the pictures of wildlife obtained in camera traps during National Tiger and Prey Base Survey 2018 and prepared the list of species. We also incorporated the species which were photographed in previous years between 2013 and 2017 but not during the survey of 2018. The survey of 2018 covered a larger landscape in the North and East of the Park but we focused on the species photographed in the Park and forests.

All the photographs of species presented in this book are taken exclusively in and around the Shuklaphanta National Park; most of them were obtained from the camera traps. As camera trap pictures are not high resolution and animals not always come close or pose to the cameras, pictures may not be very impressive but these serve as evidence of the species existence in the Park. For each species we have presented the distribution of photographed locations (map and table), standard capture rate (number of independent detections) along with common name, scientific name and protection status. The maps presented in this book partially represents the distribution of the species as it shows only the camera trapped location; the actual species distribution might be larger. We hope this book will be useful for the researchers, tourists and anyone interested to wildlife of Shuklaphanta. We will highly appreciate any feedback on the book.

Introduction

Shuklaphanta National Park

Shuklaphanta National Park is situated at the southwest corner of Nepal in Kanchanpur district of Far West State. It lies between $28^{\circ} 45' 47''$ - $29^{\circ} 02' 52''$ latitudes and $80^{\circ} 05' 45''$ - $80^{\circ} 21' 43''$ longitudes. The altitude ranges from 175 - 1300m above sea level.

The park was a famous hunting area for royalties of Nepal and their distinguished guests for a long time. It was declared as Royal Hunting Forest with an area of 131 km² in 1969. Later it was promulgated as the Royal Shuklaphanta Wildlife Reserve in 1976 covering an area of 155 km² and extended to the present size of 305 km² in 1994. The area of 243.5 km² surrounding the reserve was declared as buffer zone in 2004 to join the hands with local people for conservation and development. The reserve was renamed as Shuklaphanta Wildlife Reserve in 2006 and its status was changed to a National Park in 2017. The name Shuklaphanta is taken from the largest grassland of Nepal **Shuklaphanta** which is a home to the largest herds of Swamp Deer in the world.

Boundary	Major landmarks
North	Settlements, forests and Dadeldhura District boundary in the Siwalik Hills. The park adjoins with two municipals of Kanchanpur: 1. Bhimdutta 2. Bedket and one municipal of Dadeldhura: 1. Parashuram
East	Syali River. The park adjoins with two municipals of Kanchanpur: 1. Shuklaphanta 2. Laljhadi
South	Settlements and Nepal India Boarder. The park adjoins with two municipals of Kanchanpur: 1. Beldadi 2. Belauri. Lagga Bagga forests and grasslands of Pilibhit Tiger Reserve lie in the Indian side.
West	Mahakali River. The park adjoins with one municipal of Kanchanpur: 1. Mahakali

The park is a part of the transboundary Terai Arc Landscape (TAL), and connected to Dudhuwa National Park, India towards East via Laljhadi Forest corridor and Nandoor Wildlife Sanctuary, India towards Northwest via Boom-Bhramadev forest corridor and Mahakali (known as Sarada in India) River. Majority of the park lies on the Gangetic flood plains and the common soil types are sandy loam, silty loam and clay loam.

Camera Trap Survey

List of the mammals prepared in this book are primarily based on the species records on camera trapping survey of 2018. We have also included some species photographed in camera traps between 2013 and 2017 but not photographed in 2018. The camera trapping followed the tiger and preybase monitoring protocol (DNPWC, 2017*) with primarily objective to study the density and abundance of tigers. In addition to tigers, the camera traps also detect various other wildlife including rare and endangered species.

Systematic survey was carried out overlaying 2x2 km² continuous grid cells across the Shuklaphanta National Park and adjoining forests. Paired camera traps were placed for 15 days at a location maximizing the probability of photographing tigers and safety of camera traps within each grid cell. Motion sensor camera-traps (Reconyx 500 & 550, Bushnell Trophy Cam HD, Panthera camera V4, V5, V6 and Cuddeback attack) were positioned 45 cm above ground, perpendicular to, and 5-7 meter either side of game trails, forest roads, and riverbeds without using any bait or lure. Camera traps were mounted on trees or on wooden poles and checked at least twice in a week. These motion sensors cameras took three pictures per trigger with no delay between the triggers when or other animal moved in front. Photos obtained in camera traps were systematically sorted species wise into folders.

Number of locations (grid cells), the species was captured, number of independent detections and the detection rate (per 100 trap days) for each species were calculated from the camera trap photographs. For this calculation we only used the camera trap records of the species within Shuklaphanta National Park during 2018 survey. Photograph of a species taken within an hour from a location was considered an independent detection. Species which were photographed in previous years but not in 2018 survey were also included in the list of the list of mammals photographed in camera-trap but number of independent detections and detection rate was not calculated. The Detection rate for species photographed in 2018 survey was calculated using the following formula.

$$\text{Detection rate (per 100 trap nights)} = \frac{\text{Number of independent detections of a species}}{\text{Total effort (trap days) of entire survey}} \times 100$$

Camera traps are very effective in detecting many cryptic wildlife but all the mammal species found in the Park might not have been photographed. There could be camera placement bias and/or behaviour of the species to avoid cameras. The camera traps are effective tools recording the medium and large sized animals but may not adequately detect the small mammals and other small-sized animals.

* Department of National Parks and Wildlife Conservation (DNPWC) 2017. Tiger and Prey Base Monitoring Protocol (Nepal). Government of Nepal, Ministry of Forests and Soil Conservation, Department of National Parks and Wildlife Conservation, Kathmandu, Nepal.

Results

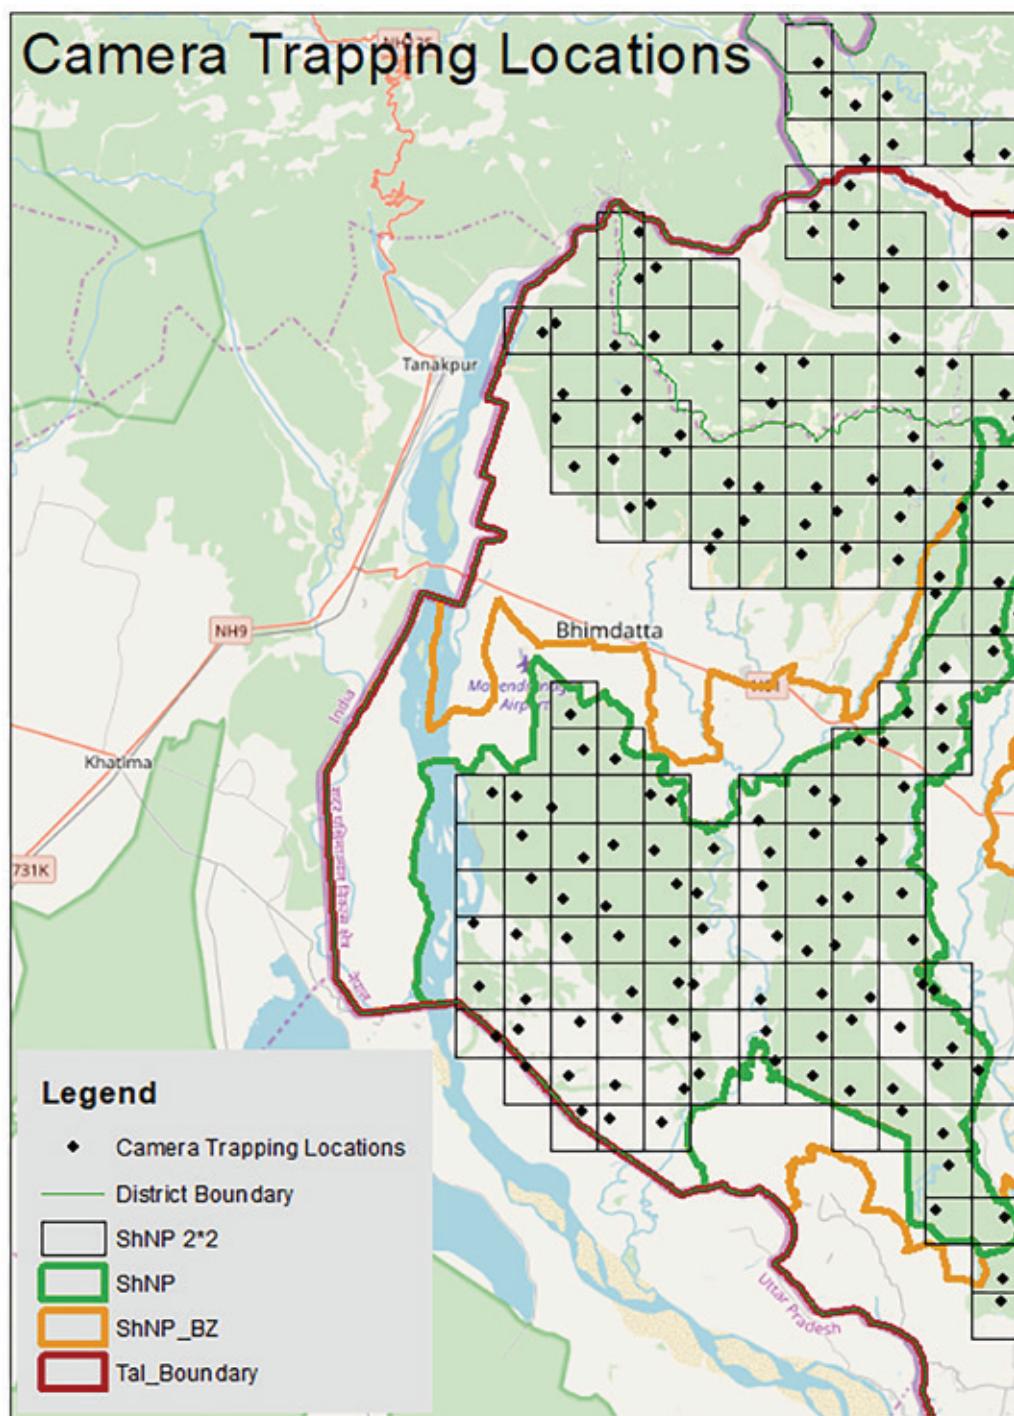

The camera trap survey of 2018 resulted a total effort of 1,605 trap days in 107 camera trap locations in Shuklaphanta NP, Buffer Zone and peripheral forests (including corridors). We recorded a total of 37 mammalian species including 32 species photographed in the camera trap survey of 2018 and additional five species were photographed during the previous surveys (2013 – 2017). Out of the 37 species recorded, more than half (n=20) were carnivores (belonging to the order Carnivora). Chital had the highest detection rate followed by Wild Boar, Indian Hare, Golden Jackal, Barking Deer, Bengal Tiger and Common Leopard. Chinese Pangolin, Masked Palm Civet, Ruddy Mongoose, Striped Hyaena, Large Indian Civet and Yellow-throated Marten were photographed only once with detection rate 0.06. Details of each species along with their detection rate and distribution map based on camera trap records is provided in following sections.

Conclusion and Recommendations

Camera trap surveys are very useful as they reveal various cryptic wildlife which otherwise remains un-noticed. Although we found more than three dozens of mammals, our records may not represent the true index of the species occurrence in the park. A species specific camera trap surveys are recommended to understand their status, distribution and threats in the park. We recommend species specific surveys for the following

- **Sloth Bear:** Recorded once in 2013 and they have not been photographed afterwards, although signs were found.
- **Sambar Deer:** This animal is photographed in few locations though this is the highly preferred prey of tigers.
- **Pangolin:** Both the pangolins are recorded in the park however Indian Pangolin is not photographed during the camera trap survey and Chinese Pangolin is photographed only in two locations.
- **Asiatic Wild Dog (Dhole):** Despite their records from Shuklaphanta, we could not find the camera trap photographs.
- **Small mammals including bats:** Most of the members of Rodentia, Chiroptera occurring in the park are missing in the camera trap photographs.

Authors Details

Laxman Prasad Poudyal holds an MSc in Natural Resource Management and Rural Development. He currently heads the Shuklaphanta National Park where he had worked as a Park Ranger during 1994-1998.

Babu Ram Lamichhane, PhD is a conservation biologist with interest in large mammals and their interactions with humans. He works as Wildlife Research Officer with National Trust for Nature Conservation.

Umesh Paudel holds Master's Degree in Anthropology. He works as Natural Resource Conservation Assistant (NRCA) with National Trust for Nature Conservation and looks after Wildlife Research and Monitoring at NTNC/BCP.

Sudip Raj Niroula holds an MSc in Environmental Science. He works as Conservation Officer with National Trust for Nature Conservation and now heads the NTNC/SCP.

Anil Prasai holds an MSc degree in Zoology specialized with Ecology from Tribhuvan University. He works as a conservation officer with National Trust for Nature Conservation at NTNC/BCC. He was a Project Chief in NTNC/SCP during 2015-2018.

Sabita Malla obtained her Masters in Wildlife Biology from Wildlife Institute of India and is particularly interested on big-cats ecology, mega-herbivores, landscape management and technologies in wildlife conservation. She is currently working as a Wildlife Biologist-Senior Manager at WWF Nepal.

Naresh Subedi, PhD specializes on large herbivores and works on range of species in Nepal. He works with NTNC as a Conservation Program Manager.

Kanchan Thapa is wildlife lead at WWF Nepal. He holds a PhD in Wildlife Science. His research works focus on carnivore population ecology and dynamics.

Bhagawan Raj Dahal, PhD is a conservation biologist and has been working in the field of wildlife conservation for more than 15 years. He currently works as Deputy Country Representative for Zoological Society of London (ZSL) Nepal office.

Shuklaphanta National Park is managed by the government agency of Nepal under the Department of National Park and Wildlife Conservation (DNPWC). The Park lies in south-west part of Nepal. It is part of the transboundary Terai Arc Landscape; connected with the Pilibhit Tiger Reserve, Dudhwa Tiger Reserve and Nandhaur Wildlife Sanctuary in India through biological corridors. It supports diverse flora and fauna.

Shuklaphanta National Park aims for the conservation and management of wildlife, ecosystems and overall biodiversity while ensuring benefits for the human communities living in the fringe of the Park. Its activities are focused on wildlife and habitat management, wildlife crime control, tourism promotion and development, research and monitoring, and forest independent alternative livelihoods for the local people.
